

STEP ONE

Create a new account

Autoconfig Wizard

The Wrapper is a specialised email client and it uses the same settings as Outlook Express. It uses the same settings for your email account. The database is maintained by the people who use it for their own email client called Thunderbird. This date, this endows the Wrapper with a great deal of chance to auto detect your email settings.

Please provide the authentication details for your email account

Thunderbird Database

Authentication Details

Email Address:

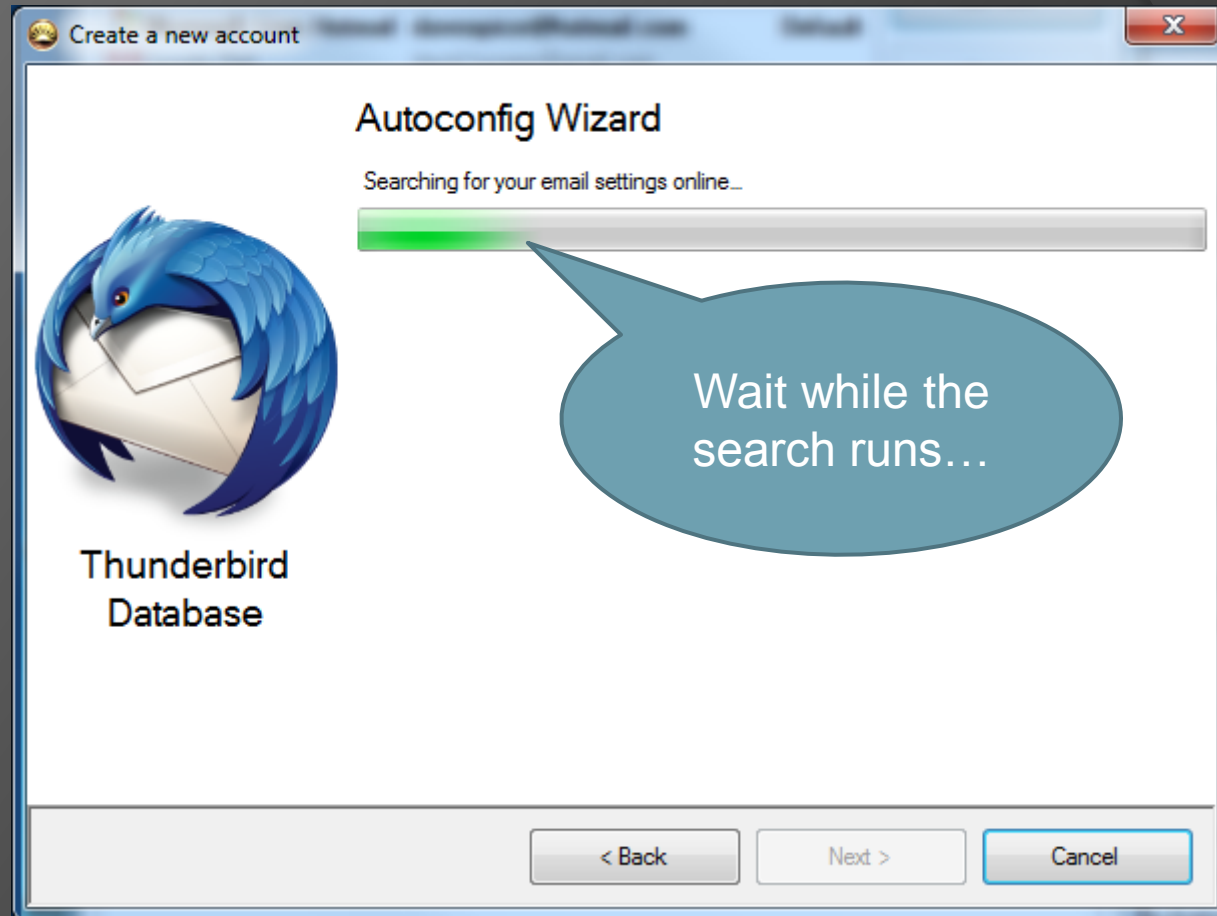

Password:

Next > Cancel

Enter your email address and login password

Then press Next...

STEP TWO

OUTCOME 1

OUTCOME 2

Create a new account

Autoconfig Wizard

Searching for your email settings online...

Result

 Unsuccessful, no email settings were found. Please choose one of the options below.

What next?

☒ Try Mx Lookup

Sometimes your email server is listed in the online database under a different name to your email address. If we do an Mx Lookup on your email address and then run the database search again this can often find the correct settings.

☐ Try to guess

Use this option as a last resort. This will predict the name of your email server by attempting to contact them directly over the Internet, this is not guaranteed to work. If this fails you may need to enter the settings manually.

☐ Manual override, let me enter the settings myself

Thunderbird Database

< Back Next > Cancel

Try both of these, you will return to this screen if they fail

Manual entry is the last resort...

Press Next...

STEP THREE

Create a new account

Autoconfig Wizard

Please specify which server settings should be used.

Options

☒ Let the Wrapper decide (default)

Preference:

This is the safest option for most users. It will instruct the Wrapper to choose the most secure servers based on the preference above. If no preference is given the Wrapper will pick IMAP servers over POP3 ones when choosing.

☐ Manual override, show the settings so that I can choose

Use this option if you want to have precise control over which auto detected settings the Wrapper should use.

Press Next...

STEP FOUR

Age of Wonders Email Wrapper - david.honess@gmail.com

Accounts | Activity Log | Preferences | About

Account	Email Address	Default
 Google Mail	david.honess@gmail.com	Default

Add New
Delete
Rename
Activate
Set as Default

Incoming Email | Outgoing Email

☒ Check for email every: 10 minutes

Server

Email Type: IMAP

Server: imap.googlemail.com

Port: 993

SSL Type: SSL

Authentication Details

User name: david.honess@gmail.com

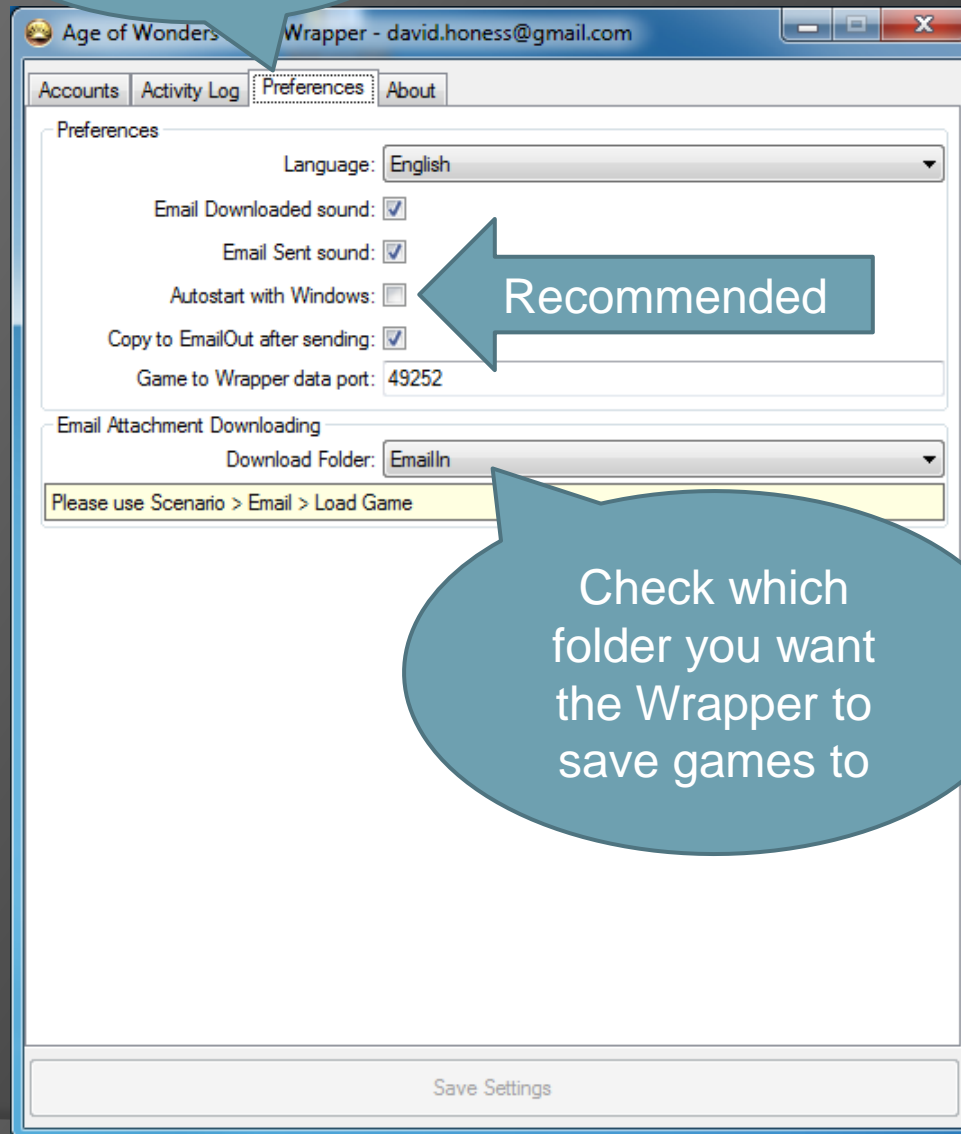

Password:

Save Settings

Add more
accounts
here if
needed

Select
Preferences

STEP FIVE

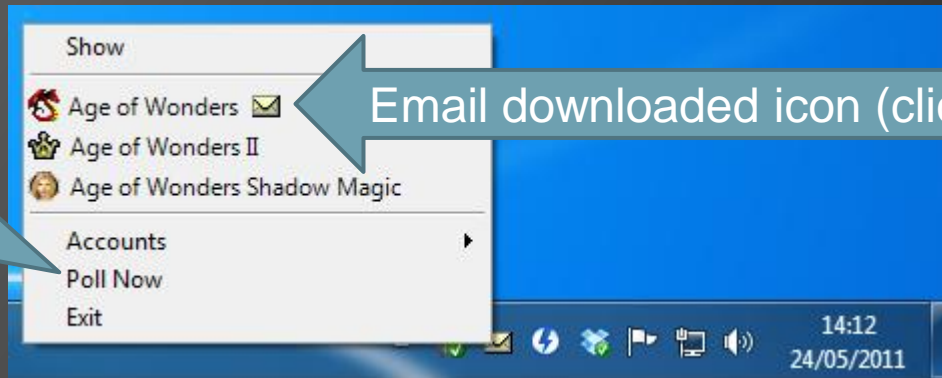

Check which
folder you want
the Wrapper to
save games to

STEP SIX

Right click

Click 'Poll Now' to check for email

Email downloaded icon (click to run game)

If nothing happens when you click 'Poll Now',
go to the [HELP / CHECKLIST](#) page

STEP SEVEN

Use Automated just works

Click End
Turn as
normal

This is the same for Aow, Aow II and Aow SM.

HELP / CHECKLIST

There are couple of email *evils* that some users can be caught out by, these are fundamental issues with email technology though – so it's probably not your fault!

Trick: If nothing happens when you Poll Now, just forward the game email back to yourself and try again. The Wrapper ignores all existing email in your account when you first poll for email. This is necessary to prevent it from downloading all your old game turns that could still be in your Inbox (and also for speed). Future turns should be downloaded first time though.

Remember: If your Incoming Email tab has **IMAP** as the Email Type, you must have the emails in the Inbox and they must be marked as Unread. The Wrapper works with unread IMAP email only because of the speed advantage.

Remember: If your Incoming Email tab has **POP3** as the Email Type and you use a windows based email client, like **Microsoft Outlook**, you will need to change an option to tell Outlook to leave the messages on the server so that the Wrapper can find them. Search Google if you need to find how to set this. Also applies to any windows based POP3 email client, but don't worry if you always access your email through a browser.

Remember: Some email provider services require you to explicitly switch on SMTP (for sending) and IMAP or POP3 access (for receiving). Some email provider services also make you pay, Yahoo Plus for example.

STILL STUCK?

If you are still stuck, please consult the Wrapper Documentation PDF. This is a very readable and easy to understand manual.

It should contain everything you need to know.

You can also email me, but if you ask me something that is blatantly in the manual I will reply with RTFM! 😊

david.honess@gmail.com

Thanks for using the Wrapper!
